About this PDF. This PDF was generated from the online guide at **/how-it-works/restaurants/restaurant-menus**. The online version is the primary, most current edition.

SOP LIBRARY / RESTAURANTS **ENGLISH**

Manage menus and items

Guide ID	**restaurant-menus**
Revision	Revision 2 (generated October 16, 2026)
Intended for	Restaurant owner, Restaurant manager
Availability	**Supported**
Online version	/how-it-works/restaurants/restaurant-menus

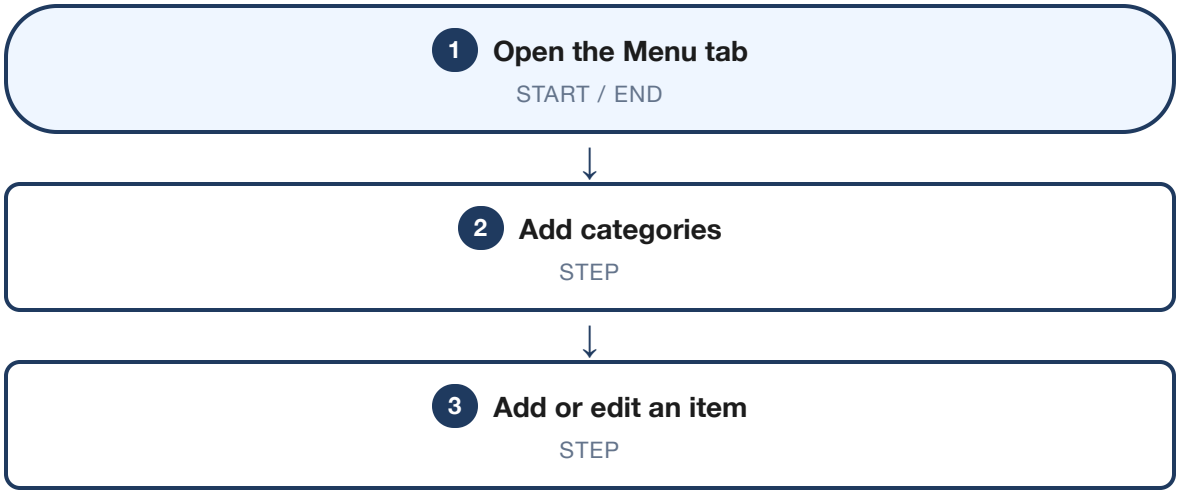

Goal

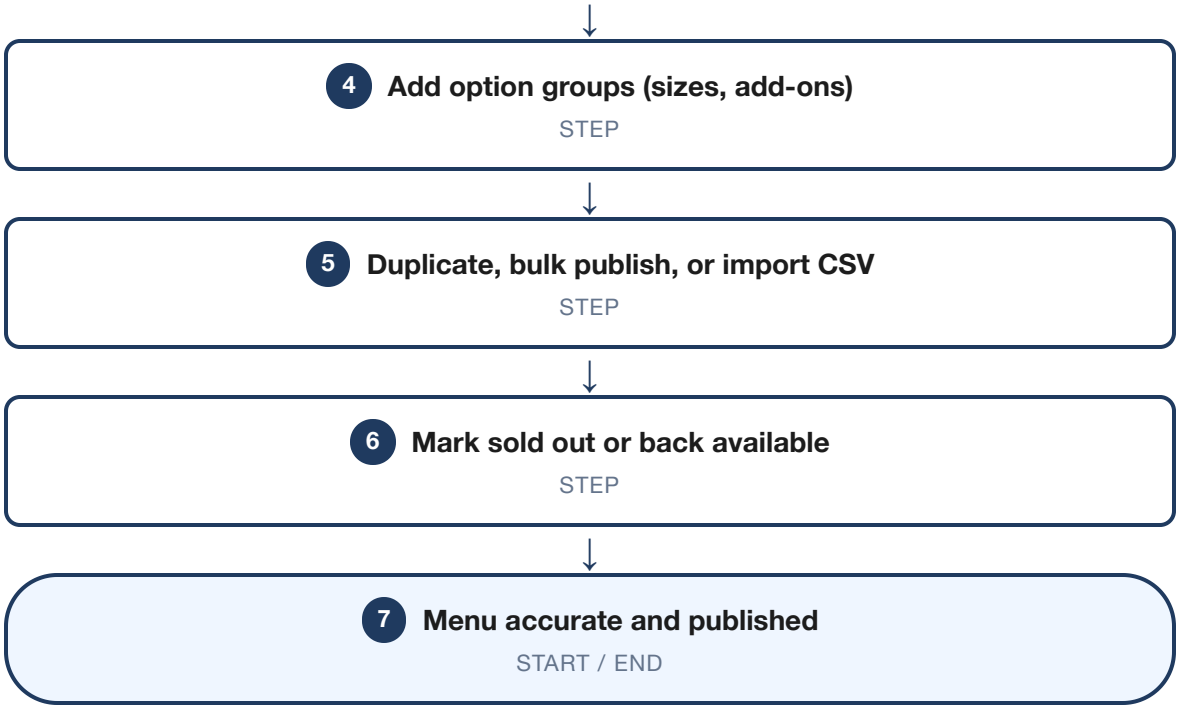

Keep the restaurant menu accurate: add items and categories, set prices, manage options, and publish what customers can order.

Before you start

1. Sign in and open the restaurant dashboard.
2. Finish restaurant setup so you can open the dashboard.

Process map

Text version. Open the Menu tab on the restaurant dashboard. Add categories first, then add items with names, prices, descriptions, and categories. Attach option groups for sizes or add-ons, then duplicate or bulk-publish items, or import a CSV. Mark items sold out or available as stock changes so the menu always matches what the kitchen can make.

Steps

Step 1: Open the Menu tab

On the restaurant dashboard at /restaurants/merchant, choose the "Menu" tab. The menu manager opens with the "Menu" heading and the "Add item" and "Import CSV" buttons.

> **Expected result:** The menu manager lists your current items and categories.

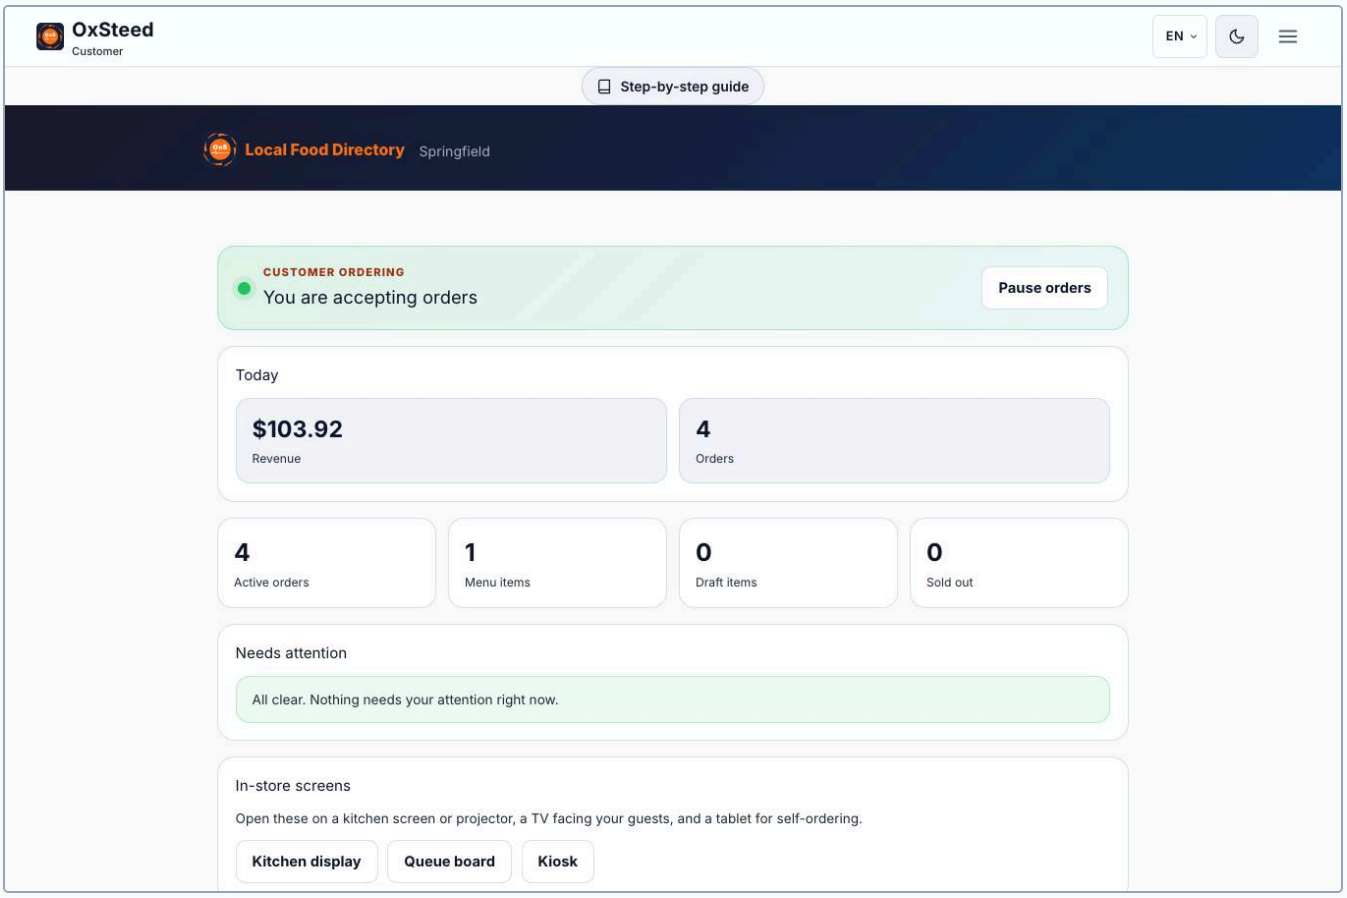

Figure 1. Screen overview. Some controls described in this step are not shown in this synthetic example. *(Image description: Menu manager tab with the item list)*

Step 2: Add categories

Use the "Add category" field and enter a name like "Burgers" ("New category name (e.g. Burgers)"). Adding categories first keeps items organized for customers.

> **Expected result:** The new category appears in the item list and in the "Category" dropdown.

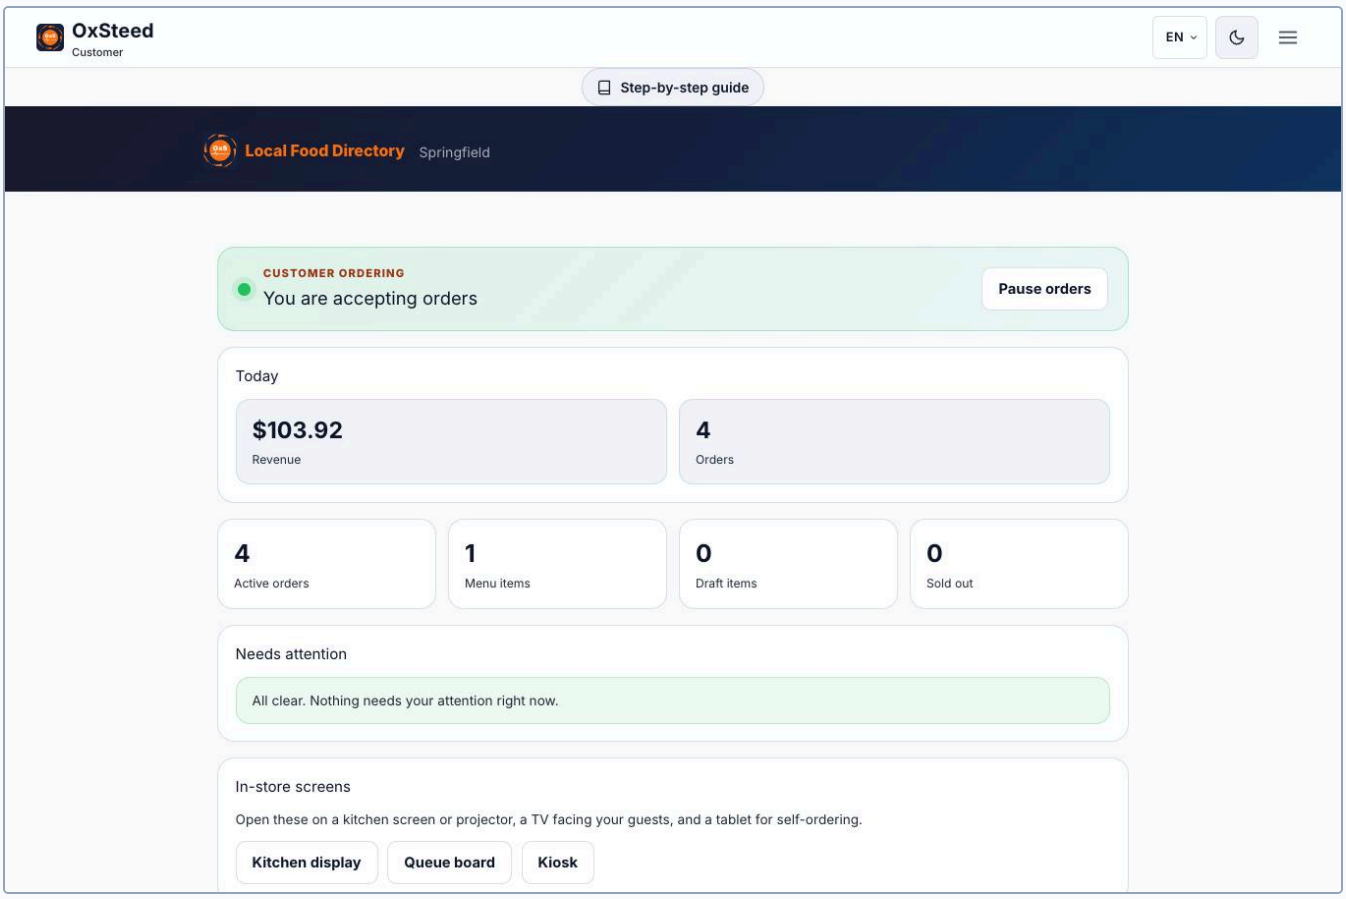

Figure 2. Screen overview. Some controls described in this step are not shown in this synthetic example. *(Image description: Add category field in the menu manager)*

Step 3: Add a menu item

Choose "Add item". In the "New item" editor, enter the "Item name", "Price", "Description", and "Category" ("No category" keeps it uncategorized). Choose "Save". A $0 price shows the warning "This item is priced at $0. Customers can order it for free." and an unusually high price shows "That price looks like a typo" with "The price is correct" to confirm.

> **Expected result:** The item appears in the list with its price and category.

Step 4: Add option groups for sizes and add-ons

On an item, choose "Options". Enter the "Option group name (e.g. Size)", the "Max choices", and the "Choices (Name:price in cents, comma separated)" (for example "Small:0, Medium:50, Large:100"). Choose "Save". If an item has no option groups yet you see "No option groups yet. Add sizes, add-ons, or choices before saving."

> **Expected result:** Customers can pick the options when they add the item to their order.

Step 5: Duplicate, bulk publish, or import from CSV

Use "Duplicate" on an item to create a draft copy you can rename. Use "Publish" to bulk-publish selected items. For a large menu, choose "Import CSV" and fix any rows flagged with reasons like "missing name", "invalid price", or "price is $0" until you see the import summary.

> **Expected result:** Items move from draft to published so customers can order them.

Step 6: Mark items sold out or available

On an item, use "Sold out" when the kitchen cannot make it, and "Available" when it returns. Customers see the "Sold out" badge on the menu and cannot order it while it is marked.

> **Expected result:** The item badge updates immediately on the customer menu.

Confirm it worked

The customer menu shows the current items, options, and availability, with no drafts you meant to publish.

If something goes wrong

Problem	What to do

An item does not appear on the customer menu.	Check that it is published (not a draft) and not marked "Sold out". The Home tab also alerts when "{{count}} draft items are not published".
Saving an item fails.	You see "Could not save. Please try again." Retry after checking your connection; the price fields must be valid numbers.
CSV rows were skipped.	The import lists the reason per row ("missing name", "invalid price", "price over $500 looks like a typo"). Fix the CSV and import again.
